

German, Leitz 10 x 80 Observation Binoculars

£3,950

REF: 31853

Height: 22 cm (8.7")

Width: 48 cm (18.9")

Depth: 42 cm (16.5")

Description

Second world war 10 x 80 observation binoculars.

A pair of German ex military observation binoculars with 45° incline eyepieces mounted onto an aluminium cradle and gimble. The whole apparatus sits on a modern aluminium adjustable tripod. The binoculars are marked 'D.F. 10 X 80 beh OX', 13422, and are made by one of the best German optical manufacturers, Ernst Leitz GmbH of Wetzlar. beh is the secret manufacturing code assigned to Ernst Leitz by the German Army Ordnance Department. There are two knobs on the top of the binoculars, the knob on the right-hand side is for interocular distance adjustment, the left knob is marked 'mittel - hell - klar - dunkel' and is for the shade settings for the lenses, medium - bright - clear - dark. The eyepieces can be focused individually and the optical quality of the lenses is remarkable giving a stunning view. This is a fine pair of binoculars with a highly polished finish, giving it a sculptural look.

The measurements are without the tripod.

These large aperture binoculars produced during the Second World War were developed for their superior magnification and were manufactured for their specific military purposes where quality and dependability were more important than cost. They were used for long range land observation, aircraft identification or to facilitate the direction of anti-aircraft fire. Being large they were usually mounted onto heavy tripods and were also used on coastal installations as 'look-outs' or mounted to large heavy deck mountings on war ships. There is an image showing of a wartime photograph showing the flakglass mounted onto the flak direction apparatus being used by female assistants (taken from the book - Militärische Ferngläser und Fernrohre by Hans Seeger).

The DF 10 X 80 Flak Glass was manufactured in abundance during WWII by a number of German companies. The original design was by Emil Busch Optical Industries of Rathenow, their manufacturing code was cxn. The German Army Ordnance Department assigned secret manufacturing codes to the different companies, some of the other well known manufacturers were Josef Schneider (dkl), Carl Zeiss (blc), Ernst Leitz (beh), R. Fuess, vorm. J.G. Greiner & Geissler, Optische Industrie, Berlin (cro), Optische Anstalt C.P. Goerz GmbH, Wien 75, Sonnleithnergasse 5 (bpd) and Optische Präzisionswerke GmbH, Warschau (eug).

The D.F. engraved before 10x80 on the binoculars stands for Doppel-Fernrohr (double telescope) and they are mechanically joined together along the horizontal axis with both the left and right sides being separate entities. In addition to DF 10 X 80 and the serial number symbols such as ?, ? and X can be found engraved on the body of the binoculars. These give the indication of grease used on the devices and the different symbols appeared in different years as improvements in lubricant performance or availability changed. It is not unusual to have several markings as some instruments returned for servicing, repair or were re-greased and would have had the latest lubricants applied and thus the current symbol being added even if a previous one already existed.

An approximate date of some of the different lubricant symbols are

K.F. : 1940-41
